SUMMARY

Eight years building data-heavy products across telecom infrastructure and startups. I work on the interfaces, the APIs behind them, and the pipelines that feed both. I have owned features end to end alongside data science and engineering, built internal tools that teams chose to use, and shipped systems handling global-scale weather data. I am now looking for a role that puts me closer to the people using what I build.

EXPERIENCE

Cloud Engineer · Development Seed

Sep 2025 – Jun 2026

Open-source geospatial and data technology supporting NASA and NOAA Earth observation programs.

- Evaluated commercial Earth observation data for NASA's Commercial Satellite Data Acquisition Program (CSDA), assessing imagery and sensor data quality, metadata completeness, and utility for Earth science, supporting decisions about which datasets and providers the program took on.
- Worked on the back-end systems behind that assessment, standardizing how data from multiple commercial providers with differing interfaces and metadata models was checked and compared.
- Improved how researchers find, request, and receive satellite imagery by reworking tasking workflows and cloud infrastructure.

Senior Software Engineer · Tomorrow.io

Nov 2022 – Sep 2025

Weather intelligence helping organizations anticipate weather impacts on operations.

- Owned ingestion, validation, and data delivery end to end, working with engineering and data science to set priorities and decide what shipped in what order.
- Spotted a visibility gap in daily operations and shipped a data validation UI that became the team's primary window into data integrity, reshaping how the operational work got done.
- Removed a standing dependency on infrastructure review by packaging Terraform into reusable modules and automation, letting scientists and engineers deploy their own work.
- Directed the platform's migration from GCP to Azure and built internal buy-in for KEDA-based serverless scaling on high-volume global ingestion, later moving workloads to ScaledJobs as usage patterns changed.
- Established the Datadog dashboards and observability practices the team relied on, so failures surfaced as shared metrics instead of customer complaints.
- Ran sprint planning and daily standups, and wrote and delivered the technical enablement material behind integration workflows.
- Stayed hands-on in the system: built and maintained the Rust ingest applications and shared libraries the platform runs on.

Software Engineer · Ordermark

Oct 2021 – Jul 2022

Aggregated online ordering providers for restaurants and virtual kitchens into one dashboard and printer.

- Shipped user profile accounts on Auth0, including the REST APIs other applications and services depended on to read and update profile objects.
- Built back-end logic in FastAPI and integrated SendGrid to give the product a direct channel to customers over email.
- Partnered with the back-end team on a queueing system for future ordering on AWS S3, Lambda, CloudWatch Events, and CloudWatch Alarms.
- Set up Cypress end-to-end testing in GitHub Actions and continuous automated API security with 42Crunch, so problems were caught before restaurants hit them.

DevOps Developer · Shaw Communications

Jan 2020 – Oct 2021

Telephone, internet, television, and mobile services. Denver, CO.

- Moved on-prem services to AWS and built the automation, monitoring, and continuous delivery infrastructure they ran on.
- Built and maintained automated CI/CD pipelines with CloudFormation, CodeBuild, CodeDeploy, Bitbucket, and Git.
- Cut repeat work across teams with reusable SNS topics that notified Slack and Teams from any project, plus Python scripts that made recurring processes self-healing.

DevOps Engineer · Zayo Group

Jun 2018 – Jan 2020

Fiber and bandwidth connectivity, colocation, and cloud infrastructure. Boulder, CO.

- Built and maintained automated CI/CD pipelines using GitLab, Copado, and PowerShell.
- Built test automation for infrastructure provisioning and supported new and upgraded systems environments through automation tooling.

S K I L L S

Product	Roadmapping and prioritization, scoping and trade-off decisions, technical specs and requirements, discovery with internal users, cross-functional alignment across engineering and data science, vendor and partner coordination, agile delivery (sprint planning, standups), metrics and instrumentation, technical enablement and documentation
Languages	Python, Rust, SQL
Application	REST APIs, FastAPI, React, Auth0, Cypress, JSON
Infrastructure	Terraform, AWS, GCP, Azure, Docker, KEDA, Datadog, Linux, Git, YAML
Tools	Jira, Figma, Lucidchart

E D U C A T I O N

B.A. Computer Science — University of Colorado Boulder, 2017

W O R K A U T H O R I Z A T I O N
